zykotick9: I think it's because I'm using lvm. I have an lvm command in the ui and I can get the output with it bence I tried the same thing as you with a USB and it was the same result. LVM in vbox however is working fine bence, I have no idea why LVM isn't working. bence, it would be nice if I didn't need to use VBox at all or libvirt-bin timothy_: is the process you started using Unity/gnome shell? brent: I'm not sure why I don't have this issue with the usb. maybe the live-cd is not lvm and the installation process tries to use it bence, yeah I think so. What I would like to do is make a filesystem on an external drive and then have grub.cfg and my windows installer start from there. brent: if you can have a filesystem on external drive but you use it as a device and you can't boot from it you need to have it as a separate partition bence, I understand. But Windows 10 installer has no option to create a new partition. I want to create a partition for a new OS. That's all I want to do brent: windows installation

will give you the option to create a new partition. bence, when I try that option, it says that that device (or whatever is labeled) is not ready. brent: you might try using a LiveCD to setup your install. that's "easier" than messing with LVM. good luck. xangua: Unity brent: you have to create partition from windows installation media hello, can someone tell me a way to switch from gdm to a lightdm login screen or vice-versa? zykotick9, well, I tried that. You don't understand. zykotick9, I've had this issue on all my USB devices. It's the same 82157476af
